

PEDIATRIC HEALTHCARE

FIVE ENTERPRISE AI USE CASES — INSIDE CHILDREN'S HEALTH'S CONTROLLED ENVIRONMENT

A unified AI platform for **Children's Health** — built on NeuralSeek.

NeuralSeek will design, deploy, and support five enterprise AI use cases inside Children's Health's controlled environment — each with role-based access, full audit logging, content filtering, and integration to existing IAM. All capabilities operate on governed data, with no exposure of PHI or PII outside Children's infrastructure.

ANNUAL REVENUE

~\$3 B

Estimated operating revenue · one of the largest pediatric health systems in the U.S. by revenue.

EMPLOYEES

8,000 +

Physicians, clinicians, and staff across the system.

MARKET POSITION

#1

Leading pediatric health system in North Texas, with nationally ranked specialty programs.

VOICE OF THE CLIENT

In **David's** words — a conversation with our partner at Children's Health.

A short Q&A with David Seo on working with NeuralSeek through this engagement.

CHIEF TECHNOLOGY OFFICER

David Seo

As CTO of Children's Health, David leads the technology and data organization that will host NeuralSeek's five enterprise AI use cases inside Children's controlled environment.

Q1 What parts of NeuralSeek impress you?

The governance capabilities really stand out. Most AI platforms promise HIPAA compliance, but NeuralSeek actually delivers with granular role-based access, full audit logging, and content filtering built specifically for pediatric care. The fact that everything stays within our own infrastructure while still being accessible to our clinical teams is exactly what we needed.

Q2 Thoughts on NeuralSeek having an implementation arm and experience doing enterprise go-lives.

This was absolutely critical to our decision — and we're confident it will continue to exceed our expectations as we scale. Healthcare AI implementations are complex, messy, and full of edge cases that don't show up in a demo. NeuralSeek's implementation team will be in the trenches with us, walking our clinical workflows, sitting with our informaticists to understand how our environment is configured, and helping us navigate the unique challenges of deploying AI across a pediatric setting where a five-year-old asthma patient and a teenage transplant recipient have completely different data profiles and risk factors. They'll help us design role-scoped access for our 8,000+ staff, tune content filtering for pediatric-sensitive scenarios, and integrate with our existing identity infrastructure. Most vendors sell you software and wish you luck. NeuralSeek's team rolls up their sleeves and partners with you through every go-live milestone, every workflow refinement, and every "what-if" scenario your clinical governance committee will throw at them.

Q3 General feedback on our team.

The NeuralSeek team is incredibly easy to work with — truly a breath of fresh air in the enterprise software space. What stands out most is the leadership from Marc and Lawrence, who have been deeply involved in ensuring our go-live success from day one. Lawrence's strategic vision and Marc's operational rigor create a powerful combination: they don't just set direction and step back, they stay engaged, remove blockers, and make sure their team has everything needed to deliver.

WHAT'S INSIDE THE ENGAGEMENT

5 CASES

Use cases delivered for Children's Health.

01 Clinician- & staff-facing chatbot

A HIPAA-aware ChatGPT-style assistant for Children's clinicians, nurses, and administrative staff — running inside Children's tenant with SSO, RBAC scoped to each user's role and unit, content filtering tuned for pediatric care, and a full audit trail on every prompt and response.

HIPAA-AWARE

SSO + RBAC

AUDIT TRAIL

02 Clinical Policy & Pathway chat

Pre-loaded with Children's clinical pathways, pediatric medication protocols (including weight-based dosing), infection-prevention standards, and regulatory guidance. Clinicians get answers with direct citations to the source policy and paragraph, auto-refreshed the moment a policy is republished — and any response that would expose restricted PHI is blocked before it ever reaches the user.

CITED ANSWERS

AUTO-REFRESH

PHI GUARDRAILS

03 OCR for referral packets & scanned charts

Outside records, faxed referral packets, handwritten intake forms, imaging reports, and legacy scanned charts are OCR'd in-place. Extracted content feeds directly into the chat so a clinician can summarize a referral, pull allergies or prior diagnoses, or ask follow-up questions without ever opening a separate imaging or records tool.

OCR

IN-CHAT

FAXES + SCANS

04 Self-service pediatric cohort analytics

Quality, operations, and clinical research teams ask plain-English questions of Children's governed datasets — readmission rates by service line, length of stay for a specific cohort, NICU throughput, ED wait times, outcomes by age band. No SQL, no analyst queue; every answer shows the underlying query and sourced data so results are auditable before they go into a committee deck.

NATURAL-LANGUAGE

GOVERNED DATA

AUDIT-READY

05 Family & caregiver call analytics

AI-driven insight on every inbound call from families, referring providers, scheduling, and nurse lines — not just the small sample a QA team can listen to manually. Surfaces caregiver distress signals, booking friction, unresolved clinical questions, and coaching moments so service and ops teams can intervene on the calls that matter most.
